

Welcome to the AniCONS April 2001 Icon List!

Hello, and thanks for downloading the April 2001 list! The AniCONS Icon List is a group of over 1500+ Anime icons, all compiled into one single, cross-platform icon list. We are doing things differently this time around. We have had to remove icons from the existing set and replace them to conserve space and freshen up the list. Hopefully we can keep the list size manageable. Mac users will be happy to note our icon viewer is now carbonized.

This is our fifth full public list distribution, and we welcome your comments (come to our HL server and drop us a note in the news, or talk to an admin [if you can catch one! ;p]). We have been extremely overwhelmed, again, by the many submissions, and thank you all gals & guys for all those icons!

We are instating a few new policies regarding submissions.

- #1. No more than 25 submissions per person at a time.
- #2. Names of files should not exceed 32 chars in length, including extension. ex.. (.psd)

And remember, comments, suggestions, submissions are always welcome!

This list will work on all Hotline clients (including 1.2.3), our own client AniClient (Windows), Zombie (Mac), and some Linux clients (Fidelio for one)

-The AniCONS staff team

Where to grab the list :

AniCONS icons list are currently distributed at [AniCONS Hotline server](#) and on our [website](#). Connect either your HL client or your web browser there, and just grab the list! Lists are available either in a Mac format, Zombie format or a PC format. On the Hotline server, the list is in the 'current list' folder, either in 'PC', 'Zombie' or 'Mac' subfolders.

Installation instructions:

Mac OS Users : After downloading the Mac list, UnStuff it, and replace the 'User Icons' file in your Hotline Client folder with the one you just extracted. (Make sure to quit the client first!) That's all! You should be able to see the icons of people using AniCONS! To browse the icons, double click the 'User Icons' file or head over to our online viewer.

Zombie Users : After downloading the Zombie list, UnZip it and replace the 'User Icons' file in your Zombie Client's 'Addons' subfolder with the one you just extracted. (Make sure to quit the client first!) You now should be able to see AniCONS icons. To browse the icons, double click the 'User Icons' file, open up the builtin icon browser in Zombie or head over to our online viewer.

Windows Users : After downloading the PC list, UnZip it and replace the hotline.dat file in your Hotline Client's 'Data' subfolder with the one you just extracted. (Make sure to quit the client first!) You now should be able to see AniCONS icons. To browse the icon list, you need to download the PC Icon Viewer, available on our Hotline Server or you can use our online viewer.

Fidelio users : Use the PC/Windows list, extract the Hotline.dat file to a convenient location. Then add this file to Fidelio's 'Dat' list (in 'Options'). You should be able to see the icons with Fidelio's integrated viewer.

To select an icon :

First find the icon you want to use and note its number, using either the integrated icon viewer (Mac/Fidelio/Zombie), the external one (Windows), or the online browser (All OS). Then follow the instructions below.

Mac OS and Windows Users : Open your Hotline client, hold down the 'Ctrl' key and press 'F12'. A dialog titled 'Secret' should appear; in the top line enter 'icon', and in the bottom line the icon number you selected. Then press 'Execute'. Finally open the 'Options' dialog, and without changing anything click the 'Save' button. That's it!

Zombie Users : Open your Zombie client, hold down the 'command' key and press 'I'. A dialog titled 'Icon Browser' should appear. Select your icon by clicking on the desired icon. That's it!

(Note: Due to a bug in Zombie you may have to click the icon below the actual one to be selected. Not our fault. Sorry.)

Fidelio Users : bring up the 'options' dialog, 'user info' tab, click the 'icon' button and select the one you want to use. You will have to relogin to servers for the change to take effect.

The Staff:

Acru is our resident Mac coder. He created a new Mac Icon Viewer, and updated the dats for HL 1.8.4, and helped with some new icon tools!

Ryo, our resident PC coder, is currently coding AniClient. He also created a new PC Icon Viewer for us, and contributed many icons as well as reviewing icons.

Kenshin came up with the idea to continue the AnimeCORE List, and made a bunch of icons.

Yep, that's me, I run AniCONS Server, the main distribution point for AniCONS, and I maintain the webpage (with help from Ybot of delicio.org), the docs, and compile the list now.

Our Server Werewolf of sorts, the second in command, the man with (almost) all the answers.

All around contributors, and icon submissions reviewers, and misc. We couldn't have done it without them.

Special thanks to the old AnimeCORE list, Defor, Chem, Xcalibur, Yos, Holo, and all of the Eleventh Element guys for the wonderful inspiration and the March00 list of AnimeCORE to build off of. Many thanks go to you guys! ^.^
